

## Flipping the base for a 60mm Mount

Summary:

Adjusting your Pro Laser Tube Mount 60mm to fit your low-profile tubes.

Procedure:

- a. When you get the Pro Laser Tube Mount 60mm from us, it will look like mount 1 and so you will have to take a screw to be able to get to 2. Once this is done, you will flip the stand around and now the ring lies on the bottom side of the stand. Put the screw back. It should now look like 3.

- b. Taken a closer look at the now low-profile mount 3, we can see that now we have a way to put our laser tube and make it fit with the first mirror that happens to be low profile.
